

I CLAIM:

1
2 *add*
3 1. A hose management/contaminant barrier device for the
4 purpose of providing the user an improved degree of protection
5 and utility, the embodiment of which may be formed by machining,
6 molding, milling, injection molding, or other means, from
7 material(s) which may include but are not necessarily limited
8 to: metal, molded plastic, polymers, nylon, etc., into a sleeve
9 that may be hand-held, yet of sufficient diameter so as to
10 accommodate the diameters and specifications of the particular
11 hoses to which the different models of the device may be
12 designed to apply, and flared and/or beveled at either end, and
13 with a slot of sufficient width so as to accommodate the
14 diameter of the hose to which the various models may be designed
15 to apply, and which has been milled, machined, molded, and/or
16 otherwise formed from a suitable material into an open-sided
17 sleeve or collar, thereby permitting its installation onto the
18 hose(s) to which its described functions are to be applied. The
19 slot may be aligned parallel with the central axis, or, as in
20 the preferred embodiment of the device, aligned obliquely across
21 the central axis. The slot in the preferred embodiments is set
22 obliquely across the central axis so as to create a more sure
23 means of containment for a tensioned hose moving more or less at
parallel through the device during the retraction process.

1 2. The hose management and contaminant barrier device
2 described in claim 1 for the purpose of providing the user a
3 means by which he can partially relieve the effects of friction
4 and lay the reel-bound hose more evenly and consistently onto
5 the reel, and with which he can more effectively control and
6 otherwise direct the inbound hose onto its storage reel via the
7 most effective angle.

8 3. The hose management/contaminant barrier device
9 described in claim 1 for the purpose of creating friction by
10 leveraging the opposing inside end corners of the employed
11 device against a tensioned, flexible hose, thereby creating
12 friction points whereby the operator can assist the retraction
13 process by pushing the hose onto its reel during the process,
14 and whereby the operator can also create a braking effect for
15 the purpose of preventing powered reel over-runs or to slow a
16 running hose.
